06. October 2021

# MOTIVATION Peer-to-Peer (P2P) Networks

- Peer-to-Peer (P2P) networks are well-known and established in the research community
- Various applications have been established, e.g.
  - Open-source money (Bitcoin, ...)
  - Online games
  - ····
- P2P networks can be classified in
  - Unstructured
  - Structured

Figure 1: Number of publications over time

# INTRODCUTION <u>BA</u>lanced Overlay m-ary <u>Tree Overlay Network\*</u> (BATON\*)

#### BATON\* [1]

- Based on BATON[2]
- m-ary height-balanced tree:
  - In the any node in the tree, the height of any two subtrees of its children differ by at most 1 ...

#### System Model

- Represented by (level:number), e.g. 4:8
- Maintains links
  - Parent, up to m-children,
  - RoutingTable (RT) = LRT + RRT
  - Left- and right adjacent

Figure 2: The BATON\* tree has a height of 7. Since node (4:8) has links to neighbors (4:0) and (4:4), links to the children are (5:0), (5:1), (5:8)

# WEAKNESSES OF BATON\* An Analysis of BATON\*

- Distributed Hash Table might require Load Balancing
- Rotation can lead to invalid RT entries
  - SearchCost will be infinite
  - Not deterministic
- Mutual Exclusion during join [3] during network restructuring

# Not an optimal height

Figure 3: The BATON\* tree has a height of 7. Since node (4:8) has links to neighbors (4:0) and (4:4), links to the children are (5:0), (5:1), (5:8).

# NULL-BALANCED M-ARY TREE OVERLAY NETWORKS **nBATON\* - System Model**

Null-balanced[4]:

Definition: "An m-ary tree is null-balanced if any two leaf nodes differ in level by 1"

# $\begin{array}{c} 0:0 \\ 2:0 \\ 3:0 \\ 4:0 \\ 4:1 \\ 4:2 \\ 4:3 \\ 4:4 \\ 4:5 \\ 5:0 \\ 5:1 \\ 5:2 \\ 5:1 \\ 5:2 \\ 5:8 \\ 5:8 \\ 5:16 \\ 6:0 \\ \hline \end{array}$

Figure 4: The BATON\* tree has a height of 7 and 34 nodes in total

# Challenge:

- Find a free spot
- Minimizing the tree height
- Keep the tree balanced

RQ: Has the height an impact on search?

![](_page_4_Picture_10.jpeg)

Figure 5: The nBATON\* tree has a height of 6 and 34 nodes in total

# NULL-BALANCED M-ARY TREE OVERLAY NETWORKS **nBATON\* - Adjustments to Join/Leave Operation**

Null-balanced constraints

- Only nodes on the level below the highest level can accept a new node
- Nodes from levels below the highest level need to find a successor from the highest level
- Utilizing of Dominating Set Nodes [5] to find a free spot
  - Based on the construction of the RT

$$DSN_m(l) = \{i \cdot m \mid i = 2k + 1, k \in \mathbb{N}_0, i \cdot m < m^l\}$$
$$DSN_m(0) = \{0\} \qquad DSN_m(1) = \{\lceil \frac{m}{2} \rceil\}$$

# NULL-BALANCED M-ARY TREE OVERLAY NETWORKS **nBATON\* - Adjustments to Join/Leave Operation**

Utilizing the DS:

few nodes have an overview of the level

Join/Leave Operation

Traverse the tree over the DSNs

![](_page_6_Figure_5.jpeg)

Figure 8: A node sends a join request to node (4:0). This join request gets forwarded through the dominating set nodes according to the swipe direction

# LOW-COST SEARCH IN TREE-STRUCTURED P2P OVERLAYS: THE NULL-BALANCE BENEFIT Experimental Setup m=2 — m=2

- Large-scale networks using ns-3 [6]
  - C++ development
  - Network-size from 1,000 .. 10,000 nodes
  - fanouts m = {2, 4, 6, 8, 10}
  - 1,000 search exact queries
  - 10 times with 10 different seeds

Dataset is publicly available on GitHub [7]

# LOW-COST SEARCH IN TREE-STRUCTURED P2P OVERLAYS: THE NULL-BALANCE BENEFIT Evaluation of the Cost for SearchExact Queries

Impact of height on the search

BATON\* gets outperformed up to 50% by nBATON\* in terms of routing hops

![](_page_8_Figure_3.jpeg)

Figure 10: Costs for SearchExact queries: BATON\* [6] (left) vs. nBATON\* (right)

![](_page_8_Picture_5.jpeg)

## LOW-COST SEARCH IN TREE-STRUCTURED P2P OVERLAYS: THE NULL-BALANCE BENEFIT **nBATON\* Amortization – Is it worth it?**

Break-even point BATON vs. nBATON\*

- Assumption: search are much more frequent than updates (join/ leave)
- Cost-Model based on probability for search and update operation

![](_page_9_Figure_4.jpeg)

![](_page_9_Picture_5.jpeg)

# LOW-COST SEARCH IN TREE-STRUCTURED P2P OVERLAYS: THE NULL-BALANCE BENEFIT Conclusion – We can achieve even more

Null-Balanced m-ary Overlay Tree Network nBATON\*

- Minimal height
- Utilizes Dominating Set Nodes
- Outperforms BATON\* in search queries by up to 50%

# Future Work:

- Reducing the number of hops during join/leave
  - Minimizing/ reducing the Dominating Set
- Making nBATON\* publicly available
